

Mars Colony · Mission readiness report · v0.1.0

A WILLIAM MCADA PRODUCT · Pair Pair-07 · Resilient outpost · Teacher review of reasoning and independent work pending

MISSION DECISION

Resilient outpost

Story

The outpost is ready, with at least two days of each resource remaining.

Your task

Compare the final resource reserves and explain one model limitation to your teacher.

Mars Colony v0.1.0

System diagram · checked

System	Production →	→ Daily use	Storage
Water	90 L/day	72 L/day	144 L initially; 400 L cap
Oxygen	24 kg/day	19.2 kg/day	38.4 kg initially; 100 kg cap
Food	0 kg/day	14.4 kg/day	172.8 kg initially; 200 kg cap
Energy	144 normally / 108 storm kWh/day	114 kWh/day	36 kWh usable battery

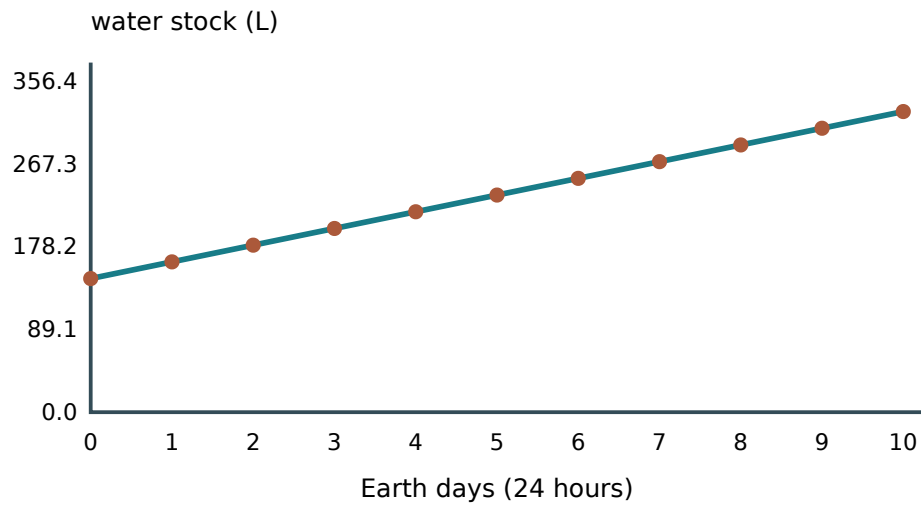

Production → daily use → storage change. Storage is an amount, not an extra daily production rate. This is daily accounting, not a model of continuous electrical supply.

Daily end-of-day stores; excess production spills at the cap

Earth day	Water (L)	Oxygen (kg)	Food (kg)	Battery (kWh)	Unservd energy (kWh)
0	144	38.4	172.8	36	0
1	162	43.2	158.4	36	0
2	180	48	144	36	0
3	198	52.8	129.6	36	0
4	216	57.6	115.2	30	0
5	234	62.4	100.8	24	0
6	252	67.2	86.4	18	0
7	270	72	72	36	0
8	288	76.8	57.6	36	0
9	306	81.6	43.2	36	0
10	324	86.4	28.8	36	0

Cargo manifest

Cargo item	Count / choice	Mass (kg)	Cost (cr)
water	3	450	4500
oxygen	3	600	6000
habitat	3	1200	9000
solar	4	400	4000
battery	1	80	800
Crate	standard	455.2	1000
TOTAL		3185.2	25300
REMAINING		214.8	700

Uncapped water stock rule: $S(t)=144 + (18)t$; whole Earth days 0–10. Daily storage capped; shortages flagged.

Design defense — teacher review

Choice A: A costs 200 cr less; its battery has 18 kWh after day 6. B avoids the modeled deficit.

Limitation: The daily model ignores night-time generation and battery losses.

Help used: waterDaily. Model quantities are invented classroom assumptions.
